ONCOLOGICAL PATHOLOGY OPINION & RECOMMENDATIONS:

- Marked multi-fold elevation of CA 15-3 (118.5 U/mL) and CEA (42.8 ng/mL) indicative of metastatic active neoplastic process.
- Concomitant elevation of Alkaline Phosphatase (285 U/L) warrants immediate skeletal scintigraphy / bone scan to evaluate potential osteoly
- Normocytic normochromic anemia (Hb 8.6 g/dL) secondary to chronic disease / marrow suppression.
- Urgent Multidisciplinary Oncology Board (MDT) staging review and PET-CT scan recommended immediately.
